POSITIONING/MANAGEMENT

775 W has excellent seedling vigor, plant uniformity, and root lodging that makes it a great choice for dryland areas such as Texas, New Mexico, Oklahoma, Kansas, and Nebraska. 775 W produces a semi-compact head with cream-colored seed. 775 W has medium to early maturity with some green-bug resistance.

ANNUAL SUMMER MANAGEMENT

Planting Date: Late April through mid August.

Soil temperature should be 60-65 or warmer.

Planting too early could cause slow early growth and reduction in population.

Planting Depth: 3/4" to 1 1/2" deep dependent upon the soil moisture.

Row Width: Preferably drilled in narrow rows

Planting Method: Drill preferred.

Fertilization for Top End Output: Nitrogen: 100-135 lbs./acre PPI. Phosphorus: 20-60 lbs./acre, more if the soil testing indicates less than 30 lbs./acre. Potassium: 40-50 lbs./acre. A soil test should be performed for better accuracy. The above fertilization rates serve as a guide only and will vary with water availability.

EARLY LIGHTNING BENEFITS
